Experience AMFC status channel technology

The state channel is a technology that allows block chain transactions and chain transactions to have the same security.

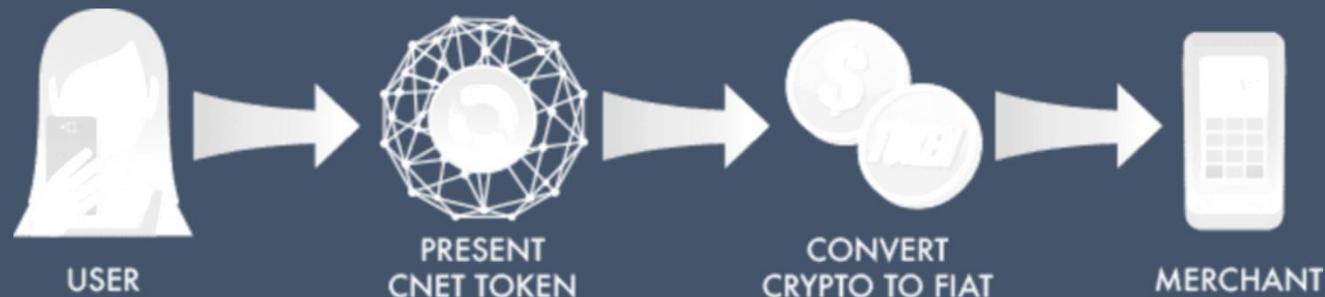

This technique makes offline transactions look like transactions on a block chain, requiring two or more users to exchange information with each other.

Participants can quickly conduct a large number of transactions between each other in the state channel, and only need to perform a block chain operation at the time of settlement.

The status channel ensures the speed required by AMFC's offline transaction purchase mechanism:

At the time of purchase, the user sends AMFC tokens to the AMFC platform in exchange for funds in the AMFC's liquidity pool and purchases them through the global payment network usage currency.

This is the least costly way to do business right now.
